1. Applicant's amendment dated 12-18-2009 was received. Claims 9-11 were amended. Claims 1-8 and 12-22 were cancelled. Claims 9-11 are pending.
2. The text of those sections of Title 35, U.S. code not included in this action can be found in the prior Office Action issued 07-20-2009.

Claim Objections

3. The claim objection under 37 CFR 1.75(c) as being of improper dependent form on claim 15 is withdrawn because the claim has been cancelled.

Claim Rejections - 35 USC § 102

4. The claim rejections under 35 U.S.C. 102(b) as being anticipated by Komada et al. (WO 03-075384, for English equivalent see US Pat. Pub. 2005/0221161) on claims 1-3, 5, 7, and 16 are withdrawn because the claims have been cancelled.

Claim Rejections - 35 USC § 103

5. The claim rejections under 35 U.S.C. 103(a) as being unpatentable over Komada et al. in view of Tsunoda (US Pat. Pub. 2004/0043270) on claims 4 and 6 are withdrawn because the claims have been cancelled.

6. The claim rejection under 35 U.S.C. 103(a) as being unpatentable over Komada et al. in view of Mottola et al. (US Pat. No. 6,179,816) on claim 8 are withdrawn because the claim was cancelled.

8. The claim rejections under 35 U.S.C. 103(a) as being unpatentable over Komada et al. in view of Nakata et al. (US Pat. Pub. 2001/0028974) on claim 14 are withdrawn because the claim has been cancelled.
9. The claim rejection under 35 U.S.C. 103(a) as being unpatentable over Komada et al. in view of Nakata et al. and Allen on claim 15 is withdrawn because the claim has been cancelled.

Allowable Subject Matter

10. Claims 9-11 are allowed. The reasons for allowance are as follows:

Regarding claim 9, Komada et al. teach a solid oxide fuel cell stack 1 with current collectors 6 and 7, an air electrode layer 4 (power generation cell), and separators 8 that are arranged in alternate lamination (see fig. 1) comprising gas discharge openings 24 (ports for discharging reactive gas) on electrode layers (abstract, par. 68). Komada et al. further disclose that there are multiple gas discharge openings 24 (ports) wherein gas is supplied to whole areas of electrode layers (abstract). The gas discharge openings 24 (ports) would inherently discharge like a shower toward the current collectors 6 and 7 and the air electrode layer 4 (power generation cell) (abstract, par.

60). Komada et al. disclose that separator 8 is hollow in order to function as the gas flow path where the gas is discharged from the gas discharge openings 24 (ports) (fig. 2b, par. 65). Such a hollow gas flow path would act as an inner flow passage for guiding reactive gas to the gas discharge ports. Komada et al. neither teach nor fairly suggest that the inner flow passage has a spiral shape.

Regarding claim 10, Komada et al. teach a solid oxide fuel cell stack 1 with current collectors 6 and 7, an air electrode layer 4 (power generation cell), and separators 8 that are arranged in alternate lamination (see fig. 1) comprising gas discharge openings 24 (ports for discharging reactive gas) on electrode layers (abstract, par. 68). Komada et al. further disclose that there are multiple gas discharge openings 24 (ports) wherein gas is supplied to whole areas of electrode layers (abstract). The gas discharge openings 24 (ports) would inherently discharge like a shower toward the current collectors 6 and 7 and the air electrode layer 4 (power generation cell) (abstract, par. 60). Komada et al. disclose that separator 8 is hollow in order to function as the gas flow path where the gas is discharged from the gas discharge openings 24 (ports) (fig. 2b, par. 65). Such a hollow gas flow path would act as an inner flow passage for guiding reactive gas to the gas discharge ports. Komada et al. neither teach nor fairly suggest that the inner flow passage has a zigzagged shape.

Regarding claim 11, Komada et al. teach a solid oxide fuel cell stack 1 with current collectors 6 and 7, an air electrode layer 4 (power generation cell), and separators 8 that are arranged in alternate lamination (see fig. 1) comprising gas discharge openings 24 (ports for discharging reactive gas) on electrode layers (abstract,

par. 68). Komada et al. further disclose that there are multiple gas discharge openings 24 (ports) wherein gas is supplied to whole areas of electrode layers (abstract). The gas discharge openings 24 (ports) would inherently discharge like a shower toward the current collectors 6 and 7 and the air electrode layer 4 (power generation cell) (abstract, par. 60). Komada et al. disclose that separator 8 is hollow in order to function as the gas flow path where the gas is discharged from the gas discharge openings 24 (ports) (fig. 2b, par. 65). Such a hollow gas flow path would act as an inner flow passage for guiding reactive gas to the gas discharge ports. Komada et al. teach nor fairly suggest that the inner flow passage is formed by multiple flow passage radially branched from the gas inlet, which is in the outer peripheral part of the separator.

11. In addition, the following prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Regarding claim 9, Akikusa et al. (US Pat. Pub. 2003/0134174) teach a separator for a fuel cell which is arranged in alternate lamination with fuel cell, the separator comprising: a gas discharge port 23b for discharging reactive gas, on layer surface thereof; and an inner flow passage for guiding the reactive gas, wherein the reactive gas is made to be discharged like a shower form the gas discharge port toward the fuel cell, wherein the inner flow passage is a spiral flow passage (fig. 4, par. 154, 155). Akikusa et al. does not teach that multiple gas discharge ports are provided on approximately a whole area of the layer surface and that the starting point of the flow passage is in the outer peripheral part of the separator.
